How can you prepare for surgery?

To help you make an informed decision, consider bringing questions like these to your surgeon or doctor visit:

- What medical options are available for my hernia?
- What happens if I don’t get surgery?
- What kind of experience do you have with my type of hernia?
- Should I get a second opinion?
- What type of anesthesia will I receive?
- How long will surgery take?
- Where will I have scars?
- How soon can I lift light weights after surgery? Heavier weights?

Important Safety Information

There are risks specific to hernia repair procedures (ventral, incisional, umbilical, inguinal), including: recurrence, bowel injury, infection of mesh, urinary retention. For inguinal hernia repair: testicular injury. Serious complications may occur in any surgery, including da Vinci® Surgery, up to and including death. Risks include, but are not limited to, injury to tissues and organs and conversion to other surgical techniques. If your doctor needs to convert the surgery to another surgical technique, this could result in a longer operative time, additional time under anesthesia, additional or larger incisions and/or increased complications. Individual surgical results may vary. Patients who are not candidates for non-robotic minimally invasive surgery are also not candidates for da Vinci® Surgery. Patients should talk to their doctor to decide if da Vinci Surgery is right for them. Patients and doctors should review all available information on non-surgical and surgical options to make an informed decision. Please also refer to www.davincisurgery.com/Safety for Important Safety Information. Unless otherwise noted, all people depicted are models.

What’s a hernia?

A hernia occurs when tissue pushes through an opening in your abdomen (ventral hernia) or groin area (inguinal hernia). A hernia can only be repaired with surgery. If you and your doctor decide that a surgical repair is right for you, talk to your doctor about all of your options, including minimally invasive surgery. One option your surgeon may present is robotic-assisted surgery. Early studies* suggest that robotic-assisted hernia repair with the da Vinci® surgical system may get you back to what matters most … sooner.

*Early studies include a single-hospital published study on inguinal hernia,* unpublished results from an inguinal hernia market research study conducted by Intuitive Surgical, presented at ISPOR 2017 Annual International Meeting* and published studies on ventral hernia.* The results from these studies may not be generalizable.

It’s about time.

Get back to what matters most... sooner.
How might you feel after surgery?

Results vary, but if you are an appropriate candidate for minimally invasive surgery, robotic-assisted hernia surgery may be a good option for you. In early studies*, people reported feeling less pain during recovery from robotic-assisted hernia surgery than after laparoscopic surgery.

A patient survey study also suggested that most people felt little to no pain one week after robotic-assisted hernia surgery.

*Early studies include a single-hospital published study on inguinal hernia1, unpublished results from an inguinal hernia market research study conducted by Intuitive Surgical, presented at ISPOR 2017 Annual International Meeting2 and published studies on ventral hernia.3,4 The results from these studies may not be generalizable.

When might you feel better?

Everyone is different, but in a market research study*, patients reported less pain, and said they experienced less disruption in their daily activities following robotic-assisted hernia surgery as compared to open and laparoscopic surgery. Specifically:

- Most people reported less disruption to daily activities.
- 86% of patients reported they were not using pain medication 1-2 weeks later.

*This market research is from an inguinal hernia market research study conducted by Intuitive Surgical, presented at ISPOR 2017 Annual International Meeting. The results from this study may not be generalizable.

What will your surgeon do?

If you and your surgeon decide that robotic-assisted surgery is right for you, your surgeon will use a 3D high-definition camera for a crystal-clear and magnified view of your hernia.

Your surgeon will sit at a console next to you and operate through a few small incisions using tiny instruments, including a camera.

Your surgeon fully controls all instruments. Every hand movement is translated by the da Vinci® System in real-time to bend and rotate the instruments for a precise repair of your hernia.

Actual Incision Size

*Early studies include a single-hospital published study on inguinal hernia1, unpublished results from an inguinal hernia market research study conducted by Intuitive Surgical, presented at ISPOR 2017 Annual International Meeting and published studies on ventral hernia.3,4 The results from these studies may not be generalizable.

Early studies* suggest that people who receive robotic-assisted hernia repair report less pain1,2 and may get home from the hospital sooner than those who receive laparoscopic or open surgery.3,4 This means getting back to what matters most to you.

We could all use more time.
