Important Information for Patients:

Serious complications may occur in any surgery, including da Vinci® Surgery, up to and including death. Examples of serious or life-threatening complications, which may require prolonged and/or unexpected hospitalization and/or reoperation, include but are not limited to one or more of the following: injury to tissues/organs, bleeding, infection and internal scarring that can cause long-lasting dysfunction/pain. Risks of surgery also include the potential for equipment failure and/or human error. Individual surgical results may vary.

Risks specific to minimally invasive surgery, including da Vinci Surgery, include but are not limited to, one or more of the following: temporary pain/nerve injury associated with positioning; temporary pain/discomfort from the use of air or gas in the procedure; a longer operation and time under anesthesia and conversion to another surgical technique. If your doctor needs to convert the surgery to another surgical technique, this could result in a longer operative time, additional time under anesthesia, additional or larger incisions and/or increased complications.

Patients who are not candidates for non-robotic minimally invasive surgery are also not candidates for da Vinci® Surgery. Patients should talk to their doctor to decide if da Vinci Surgery is right for them. Patients and doctors should review all available information on non-surgical and surgical options in order to make an informed decision. For Important Safety Information, including surgical risks, indications, and considerations and contraindications for use, please also refer to www.davincisurgery.com/safety and www.intuitivesurgical.com/safety.

Your doctor is one of a growing number of surgeons worldwide offering da Vinci Surgery.

For more information and to find a da Vinci surgeon near you, visit: www.davincisurgery.com

Endometriosis occurs when the tissue that lines your uterus also grows outside the uterus (called implants or lesions). Depending on how severe your symptoms are, your doctor may suggest lifestyle changes and medicine to control pain and endometriosis growth. If your symptoms get worse, surgery may be suggested.

There are two common surgery options: endometriosis resection and hysterectomy. Endometriosis resection involves removing all visible implants while leaving the uterus and other organs in place. Endometriosis resection is often suggested for women who want to get pregnant in the future. Hysterectomy is the removal of the uterus and possibly other affected organs. It is suggested for women who are not planning a future pregnancy.

Endometriosis resection can be done using open surgery or minimally invasive surgery using traditional laparoscopy or da Vinci Surgery (da Vinci Endometriosis Resection or da Vinci Hysterectomy).

Open Surgery: With open surgery, a large incision (cut) is made in your abdomen – large enough for your surgeon to fit his/her hands inside your body. Open surgery allows doctors to touch your organs as they operate.

Minimally Invasive Surgery: Laparoscopic surgery is minimally invasive – meaning surgeons operate through a few small incisions. Your surgeon uses a tiny camera and long, thin instruments to operate. The camera sends images to a video screen to guide doctors during surgery.

There is another minimally invasive surgery option which is robotic-assisted – da Vinci Surgery.

**da Vinci Surgery:**
A Minimally Invasive Surgical Option

With the da Vinci Surgical System, your doctor operates through a few small incisions. The da Vinci System has a magnified 3D high-definition vision system and tiny wristed instruments that bend and rotate far greater than the human hand. These features enable your surgeon to operate with enhanced vision, precision, and control.

**Early clinical data suggest:** da Vinci Endometriosis Resection may offer the following potential benefits:

- Surgeons are able to complete difficult dissections (separating of tissue)\(^1\)\(^2\)\(^3\)
- Low rate of complications\(^1\)\(^2\)\(^3\)\(^4\)\(^5\)
- Low rate of blood loss\(^3\)\(^5\)\(^7\)\(^8\) and blood transfusions\(^3\)\(^5\)
- Low rate of switching to open surgery (through a large incision)\(^1\)\(^3\)\(^6\)\(^7\)

The da Vinci System has brought minimally invasive surgery to more than 3 million patients worldwide. da Vinci technology – changing the experience of surgery for people around the world.

**Risks & Considerations Related to Endometriosis Resection (endometriosis surgery to remove implants):** injury to the bowel, bladder (organ that holds urine) or ureters (the ureters drain urine from the kidney into the bladder).
